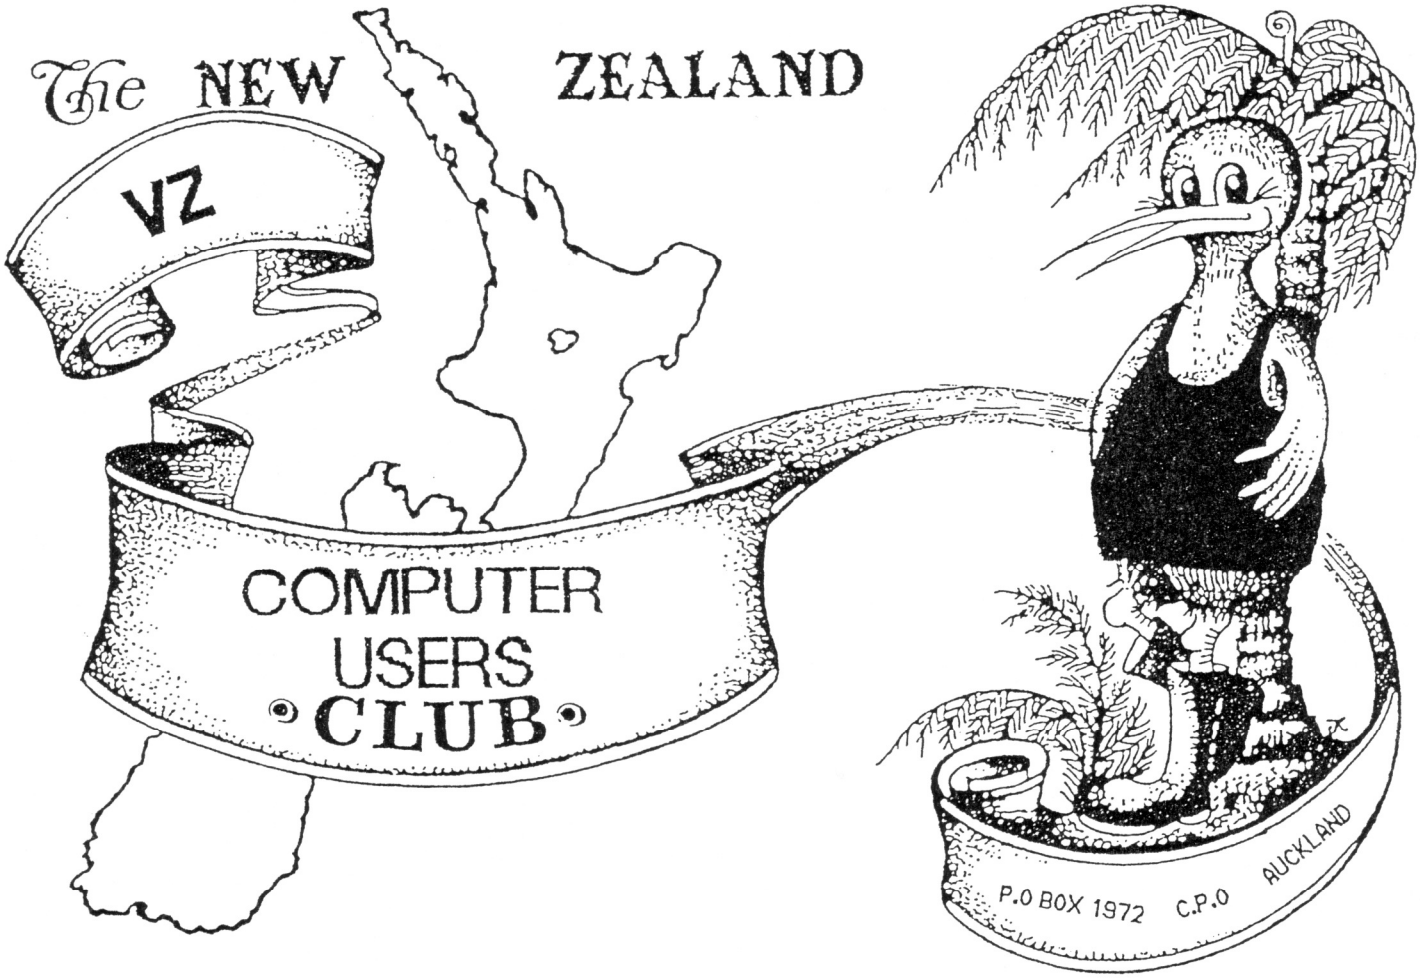
VZ LINK magazine



ISSUE 52 FEBRUARY 1991

ODDS AND ENDS

Well we made it at last, here is the February issue of your VZ newsletter.
I bet many of you have been wondering if you would get a issue this month.
I am sorry about the delay, but I have been very busy moving house and getting organised.

If you want to contact me about any problems the phone number is now: Ph. 520-6743
To those of you that have written and are still awaiting a reply, I found the file last night and will write to you before the end of the Month.
Things are very quiet as far as the computer is concerned at the moment. We still have some really interesting ideas to explore and some really good programs for you to try.

I am still looking at the idea of core group meetings on a more regular basis.
If you are interested in this idea please ring me and we can arrange something soon.
The next VZ users club meeting will be held on the following date :

SATURDAY 23 MARCH 1991

More details in the next issue. Please keep this day free if possible.

CORRECTION TO SECRET CODE PROGRAM

Here are the changes that will make this program work and spruce it up a bit.

```
Add New line :      127  SOUND 30,1
Change  line :        3  CLEAR 4500:GOSUB 550:REM INITIALISATION
Change  line :      122  I$=INKEY$:IF I$<>"" THEN 122
```

Just a word of warning here, If you type the wrong letter, DO NOT CTL-BACK ARROW and correct. The program will seem to work if you do this, but will cause a error message when you DECODE or ENCODE.
There are ways of overcoming this and when time permits I will have a look at it.

FOR SALE

I have some short cassette tapes and also second hand computer disks available for $1.00 each. All proceeds to the club and money back if not happy. Contact me if you are interested.

WANTED TO SELL OR SWAP

I have a Disk Drive, complete with controller and power supply which I would like to swap for a Telephone answering machine, Standard tape not micro.
I will sell this Disk Drive etc for $170.00 ono, if need be. Once again contact me if interested.

Anyway I will let you get on with reading the content of this newsletter. The next newsletter will be out by the 9th March, so you will not have to wait to long for it.

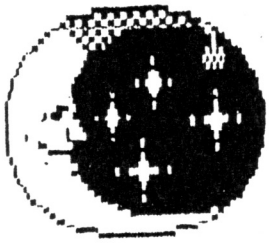
GALAXY WHERE NO MAN HAS GONE BEFORE ... DISCOVER THE RINGS OF SATURN ..



SATURN

BY

KEN CLARKE

The following program draws a spectacular view of Saturn, viewed approximately 200,000 miles away from its surface and roughly at latitude 30 degrees.

At the start 150 stars flash and a banner zips across the top of the screen. Suddenly a foreign space ship descends into view, an ominous flashing of it's portals occurs while it's motors slowly tick into life. Then with full power applied, motors screaming, it is off on it's ill fated journey.

The planet, meanwhile begins to be drawn. This is followed by it's many rings. Accompanying this is the sound channel of the VZ. After the final ring has been drawn, there is a short climax as Saturn flashes it's full brilliance.

A French alien from Mars drops out of the top of the screen. You hear him fire his retro motors prepatory to going into final orbit before landing. He plants a flag at the North Pole, pronouncing the planet as his to the tune of the French National Anthem.

Then you hear him lift off on his way home. All seems well, until the journey comes to a tragic end as his ship slams into a meteor shower and explodes.

FORTH A REVIEW

THE FORTH TUTOR VZ300 VERSION by Tim Hartnell
(The amazing VZ300 Omnibus)

Having no knowledge of Forth whatsoever when I set out to type in this program I was surprised at how easy a language it is to follow. As I was writing on a VZ300 without the advantage of Extended Basic I was able get up a working program without much hassle. The only program alterations that I had to perform were to change 3 ON-GOSUB lines to normal GOSUBs. The article accompanying the program is very informative and the program dictionary contains 63 definitions with room in it for another 50 user defined definitions. Following the examples in the article I was able to make use of the program the moment that I had finished typing it in. Upon booting up the program one is asked whether the stack is to be printed or not. As I had never used FORTH before I had the stack printed and was able to follow on screen step by step all thatwas happening as I put the program through its paces. I was able to SQUARE, DUP, ROT, DROP, SWAP and FORGET with the greatest of ease. For anyone wanting to do more with their VZ I would recommend this program, even to the extent that it justifies the cost of the book. For once I can find no fault with Tim's work.

PENGUIN

```
You have to kill all the ice     : KEYBOARD      JOYSTICK
monsters by making blocks of     : (Q)-----UP----(UP)
ice crash into the ice monsters  : (A)-----DOWN--(DOWN)
but there is a timer that starts: (M)-----LEFT--(LEFT)
at 99 and you have 4 men. If you: (,)-----RIGHT-(RIGHT)
touch one of the ice monsters    : (SPACE)-PUSH--(FIRE)
you will die. There are 31
frames in the game, each time you start a new game the frame
is different.
```

Review supplied by Michael D. Smith

Basic BASIC

Gordon Findlay continues a series on BASIC for beginners.

The message this month is "divide and conquer". It might also be "don't keep re-inventing the wheel". In other words, SUBROUTINES.

A subroutine is a part of a program, which can be called into play at any time, and which returns control to the calling program when finished. It is rather like the famous recipe book instruction, for cooking hare: "first catch your hare". The recipe didn't say how to – those instructions could be found in a hunting book. Once the hare was caught, the cook returned to the recipe book for the next step, which might be another "subroutine" or group of instructions – "next skin your hare". Enough of this hare, let's look at a BASIC example.

Very often in programming we need to sort arrays into numerical order. Quite often we will want to sort arrays several times in the same program. Wouldn't it be nice if we could write a program including the line:

100 SORT ARRAY A.

Now in one or two very powerful computer systems this is a perfectly acceptable command. In some of the more advanced BASIC there is a similar command. But in most versions of BASIC, the command to SORT would require several lines of programming. And of course, if the same sort was needed in another part of the program, the same lines of code could be copied in. But the subroutine mechanism allows the sorting code to be written once only and used repeatedly.

Let's imagine that the sorting code was written at a high line number – say 20000. Then line 110 above could be replaced by 110 GOSUB 20000.

The GOSUB (GO to SUBroutine) command works just like a GOTO, but the program remembers where it was before the GOSUB. At the end of the subroutine – e.g. at the end of the sorting – place the command RETURN. This command sends the program back to the point it was called from (the next statement actually). If we needed to sort again at line 220, the same instruction GOSUB 20000 could be used. This time the RETURN would transfer back to the statement after line 220. I have drawn a diagram which might make this clear, or might not. The skeleton program is in the left-hand column, the subroutine in the right. The arrows indicate the jumping around which occurs.

There are several reasons for using subroutines. The first, and the original, was to save space by including the code once only, no matter how often it was used. Another important one is that subroutines can be re-used from program to program. In fact, there are books full of tried and tested subroutines, just waiting to be used. Once you have written a subroutine to perform some task, it can be kept for use the next time you have a similar task.

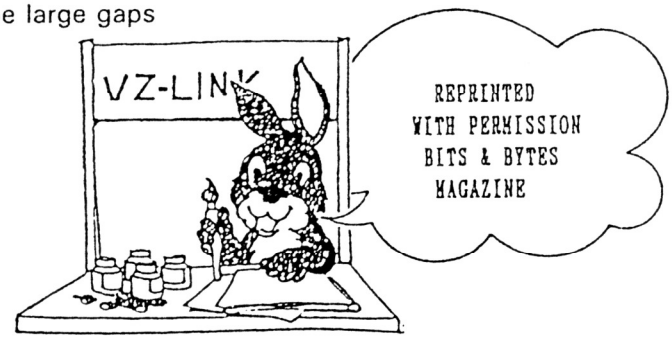
Another use is slightly different. Most people find large programming tasks fairly intimidating. Use subroutines to break the large task into smaller ones. Program each of the smaller tasks, breaking each of these up into even smaller if necessary. Then make each of them a subroutine, and call them (that is, use them as the target of a GOSUB) in turn. It's like shifting a rock – if the rock is too big to move, smash it up, and move each of the little pieces.

Where do subroutines go? The most common place is after the END statement of the main part of the program. This keeps them carefully out of the way. Many versions of BASIC run faster if the subroutines which are used often occur at the beginning of the program. This means that a GOTO is necessary to skip around them when the program begins.

```
10 REM DIMENSION THE ARRAY
20 DIM A(100)
30 . . . . .
   . . . . .
110 GOSUB 20000 ---------->  20000 REM SUBROUTINE STARTS HERE
120 (returns here the first time)  20010 . . . . .
130 . . . . .                          . . . . .
    . . . . .                  20999 REM SUBROUTINE FINISHES NOW..
220  GOSUB 20000 <----------   21000 RETURN
230 <(returns here the secon d time)
240 . . . . .
    . . . . .

900  END
```

(In an actual program of course, the right-hand column would appear beneath the left, with all the statements in numerical order, although there may be large gaps in the numbering.)



TAPE BACKUP

NOTE: For those of you that do not have a Editor Assembler program to be able to use this routine, a copy is available from me at a reasonable price. Peter.

I have included one short m/c program from Frank Rees that you may like to try, it is a very simple one but very handy if you want to make a back up copy of some tapes, it uses the computer to give you a digital copy of the original , what you do is load the program and run, then have two recorders hooked up to the computer (tape in--tape out) and what happens is that when you press play on recorder one the computer doesn't load it into memory but sends it back out to recorder two as a true digital copy. very handy for those programs that you can't copy any other way.

MODE(1) PEEK & POKE CODES

Compiled by Matthew Taylor

Well, here is a Godsend for those of you who have tackled POKEing in Lo-Res.
Its a Hi-Res PEEK and POKE chart. Your VZ has, when POKEing in Hi-Res, 32 locations going across the screen and 64 going down. Each one of the 32 horizontal locations are made up of the four colors available in Hi-Res.
You may POKE any value between 0 and 255 inclusive, (giving you 256 options), to give any combination of these colors. In other words, the POKE value specified after a screen location represents a combination of a four part pixel.
Hi-Res starts at 28672 (dec) and ends at 30719 (dec).

ie.. To place a yellow + blue + yellow + blue (YBYB) pixel in the top left hand corner of the screen, select MODE(1) and POKE 28672,102.
